

DevSecOps Advanced Course Curriculum

Harden infrastructure, containers and pipelines. Model threats. Automate security.

ADVANCED	1 MONTH	PRACTICAL
Intermediate	Instructor-Led	Demos + Project

Focus	Infrastructure	Runtime & Containers
Advanced DevSecOps security practices beyond foundational CI/CD controls.	Compliance as Code and Infrastructure as Code security.	Runtime detection, container hardening, signing and vulnerability management.

Prerequisites: Basic Linux commands, application-security fundamentals such as OWASP Top 10, and experience with DevOps tools and CI/CD pipelines.

Audience: Software developers, technical project managers, architects, operations/support teams, deployment engineers and other DevSecOps practitioners.

01 Program Overview

The Advanced program builds on DevSecOps and CI/CD experience and focuses on runtime security, compliance, Infrastructure as Code security, container security and threat modelling. The source curriculum positions this as an intermediate course with practical demos and a project.

Secure Runtime, container and infrastructure controls.	Automate Compliance and security checks in delivery workflows.	Model STRIDE-based threat modelling for secure design.
--	--	--

02 Runtime Security & Threat Detection

Module 1

- Detect and alert on behavior that involves making Linux system calls
- Use runtime visibility as a security control

03 Compliance as Code (CaC)

Module 2

- Analyze code for compliance issues
- Audit applications using InSpec
- Automate compliance checks
- Practical demo

04 Infrastructure as Code Security

Module 3

- Static analysis of Terraform code
